

I CLAIM:

1. A corner deflector suitable for use with a gutter, said corner deflector comprising:
a generally planar member having an upper edge and a lower edge, said member having first and second segments, said first and second segments being separated by a fold line, said fold line extending from said top edge to said bottom edge; and
at least one flange extending outwardly from said bottom wall of each of said segments, said flange extending outwardly in a direction substantially perpendicular to said planar portion.
2. The corner deflector of Claim 1 wherein each of said segments has one inwardly extending flange and one outwardly extending flange extending from said bottom edge.
3. The corner deflector of Claim 2 wherein said first segment and said segment are symmetrical about said fold line.
4. The corner deflector of Claim 2 wherein said deflector is formed of a metallic material.
5. The corner deflector of Claim 2 wherein said top edge has a arcuate outline.
6. In an eaves trough having a gutter guard associated therewith, said guard comprising a foraminous member covering a top of the gutter and wherein said gutter has two mutually perpendicular sections, the improvement comprising a corner deflector, said corner deflector having a first segment and a second segment, a fold line separating said first and second segments, said first and second segments lying in mutually perpendicular planes;
at least one inwardly extending flange and one outwardly extending flange being located along a bottom edge of each of said segments, said inwardly extending flanges being secured to said gutter guards.

7. The improvement of Claim 6 wherein said corner deflector is formed of a metallic material.
8. The improvement of Claim 6 wherein said first and second segments are symmetrical about said fold line.
9. The improvement of Claim 6 wherein each of said first and second segments has an upper edge which an arcuate configuration.
